

Experiment No. 2

Aim: - To set up and explore the Zoho Creator platform by creating a sample application, generating forms, reports, and dashboards, and studying the platform architecture, including the Develop, Deploy, and Manage modules.

Procedure: -

➤ Create the Sample application.

❖ Introduction

- A sample application is created to understand the basic application development process.
- It helps in learning how to organize and manage data efficiently.
- The application serves as a practice model for experimenting with different features.
- It provides hands-on experience in creating and testing application components.
- The sample application acts as a foundation for adding forms, reports, dashboards, and workflows.
- It allows users to verify that the application functions correctly before deployment.
- It helps in understanding the overall structure and workflow of an application.

❖ Steps to Create a Sample Application in Zoho Creator

- Log in to your **Zoho Creator** account.
- On the home page, click **Create New Application**.
- Select **Start from Scratch** (or choose a template if required).
- Enter the **Application Name** (e.g., *Student Management System* or *Sample Application*).
- Click **Create** to generate the application.
- After the application is created, click **Create Form**.
- Enter the **Form Name** (e.g., *Student Details*).
- Drag and drop the required fields (such as Name, Email, Phone Number, and Date) into the form.
- Click **Done** or **Save** to create the form.

- Open the **Preview** option and enter sample records to test the form.
- Verify that the records are stored correctly in the application.
- Save the application and return to the application dashboard for further development (such as creating reports and dashboards).

Add Order

Creator tip: Use this sample form to capture data. Below is an example of how it may look.

Feel free to tweak things via the form builder. Every form submission is recorded in a report and can be visualized.

Note: If you're capturing sensitive data via a field, take a look at its properties to make it secured.

➤ Exploring the platform architecture and interface

❖ Develop

1. Applications

- Applications are used to create and manage business solutions.
- They contain forms, reports, dashboards, workflows, and data.

- This is the main workspace for application development.

2. Microservices

- Microservices are independent services that perform specific tasks.
- They help split large applications into smaller, reusable components.
- This improves scalability, maintenance, and performance.

❖ Deploy

3. Environments

- Environments allow testing and deployment of applications.
- Developers can move applications from development to production safely.
- This helps ensure stable and error-free releases.

4. Mobile

- The Mobile section enables applications to run on smartphones and tablets.
- It allows users to access and manage applications from anywhere.
- Mobile apps provide a responsive and user-friendly experience.

5. Portal

- Portals provide secure access for external users such as customers or partners.
- Users can log in and interact with specific applications.
- It helps organizations share applications with authorized users.

❖ Manage

6. Users

- The Users section manages user accounts and permissions.
- Administrators can assign roles and control access levels.
- This ensures secure collaboration within the organization.

7. Organization

- Organization settings manage company information and configurations.
- It allows administrators to manage teams and account settings.
- This helps organize users and applications efficiently.

8. Governance

- Governance ensures applications follow security and compliance policies.
- It helps control access, permissions, and data protection.
- This improves the overall security of the platform.

9. Metrics

- Metrics provide reports on application usage and performance.
- They help monitor user activity and system health.
- These insights support better decision-making and optimization.

10.Operations

- Operations help manage application maintenance and administrative tasks.
- It includes monitoring, troubleshooting, and operational controls.
- This ensures smooth and reliable application performance.

11.Billing

- Billing displays subscription plans, payment details, and invoices.
- It helps organizations monitor their service usage and costs.
- Users can manage their licenses and payment information from this section.

Result: - The Zoho Creator platform was successfully explored. A sample application was created, and forms, reports, and dashboards were generated successfully. The **Develop**, **Deploy**, and **Manage** modules were studied to understand the platform architecture and application lifecycle.
